

## **StudyBuddy - Process Model**

The software process model most suitable for this project is the **Scrum Model**.

We are using this model because of the following reasons:

- It will allow rapid development of the system which would be in line with the project deadline.
- It will allow us to incorporate the user feedback and make changes accordingly to the system in the following sprints.
- We expect to have some changes made to the system in the testing and implementation phase depending on the user feedback hence, the scrum model will enable us to reduce the cost of changes.
- Our team size is small and all four members will need to work closely with each other. Hence, the scrum meetings will allow us to learn about each member's progress and keep everyone accountable thus not compromising on the quality and delivering the product in time.
